

## The Structure of Time

Saul Cisneros

As relativity attempts to demonstrate, time and distance are intertwined. Time is spent when traveling a distance ... (maybe as demonstrated when time slows down, you are not traveling any distance, somehow as you approach the speed of light you actually become still or more precisely you are not traveling in the conventional sense. Possibly conventional space moves past you at an increased rate while you come to a standstill. The speed of light could actually be a state of complete universal motionlessness to the object traveling at said speed. )... hmm.

I don't believe that there are many different universes as I believe is described by string theory. Rather there is only one universe. What brings about my conviction about this? Being "saved" I know that there is a universal Justice, no matter whether the individual believes in it or not, said individual is responsible for his or her actions and will be accountable for them. How does this relate to the structure of time? Well, many popular works of fiction set forth the idea of going back in time to change past events. As romantic such wishful thinking may be this contradicts concepts of Justice. For example if I commit a crime and then go back in time, tell myself not to do it, I listen and don't take that course of action, not only is there a paradox, but more importantly how I'm I to be held accountable for the first set of events. Furthermore I believe that it is ridiculous to think that I exist in the past, present and future. I'm not omnipresent. There is only one me and one you, here and now. However, I do believe that it would be possible to construct a device similar to a telescope but with the function of seeing into the past and the future, not much unlike Phillip K. Dick's "lens" in the movie Paycheck.
